

key Parameter

Specifies the pattern used to extract the keys from a source column by the `extractkv` transform. For the following data:

```
{ key1=value1,key2=value2 }
```

The keys are represented in the transform by the following parameter and value:

```
key: `{alpha}+{digit}`
```

This pattern matches all keys that begin with a letter and end with a digit. If the source data contains other keys, they do not appear in the extracted data.
