

# Logical Operators

## Contents:

- Usage
- Examples
  - and
  - or
  - not

Logical operators (and, or, not) enable you to logically combine multiple expressions to evaluate a larger, more complex expression whose output is `true` or `false`.

```
(left-hand side) (operator) (right-hand side)
```

These evaluations result in a Boolean output. The following operators are supported:

| Operator Name | Symbol                  | Example Expression                          | Output             | Notes                                |
|---------------|-------------------------|---|--------------------|--------------------------------------|
| and           | <code>&amp;&amp;</code> | <code>((1 == 1) &amp;&amp; (2 == 2))</code> | <code>true</code>  |                                      |
|               |                         | <code>((1 == 1) &amp;&amp; (2 == 3))</code> | <code>false</code> |                                      |
| or            | <code>  </code>         | <code>((1 == 1)    (2 == 2))</code>         | <code>true</code>  | Exclusive or (xor) is not supported. |
|               |                         | <code>((1 == 2)    (2 == 3))</code>         | <code>false</code> |                                      |
| not           | <code>!</code>          | <code>!(1 == 1)</code>                      | <code>false</code> |                                      |
|               |                         | <code>!(1 == 2)</code>                      | <code>true</code>  |                                      |

The above examples apply to integer values only. Below, you can review how the comparison operators apply to different data types.

## Usage

Logical operators are used to perform evaluations of expressions covering a variety of data types. Typically, they are applied in evaluations of values or rows.

Example data:

| X     | Y     |
|-------|-------|
| true  | true  |
| true  | false |
| false | true  |
| false | false |

## Transforms:

```
derive type:single value:(X && Y) as: 'col_and'
```

```
derive type:single value:(X || Y) as: 'col_or'
```

```
derive type:single value:! (or) as: 'col_not_and'
```

```
derive type:single value:! (or) as: 'col_not_or'
```

## Results:

Your output looks like the following:

| X     | Y     | col_and | col_or | col_not_and | col_not_or |
|-------|-------|---------|--------|-------------|------------|
| true  | true  | true    | true   | false       | false      |
| true  | false | false   | true   | true        | false      |
| false | true  | false   | true   | true        | false      |
| false | false | false   | false  | true        | true       |

## Examples

**Tip:** For additional examples, see *Common Tasks*.

### and

| Column Type      | Example Transform   | Output  | Notes  |
|------------------|---|---|--|
| Integer /Decimal | <pre>set col:InRange value:((Input &gt;= 10) &amp;&amp; (Input &lt;= 90))</pre>                         | <ul style="list-style-type: none"><li>Set the value of the InRange column to true if the value of the Input column is between 10 and 90, inclusive.</li><li>Otherwise, InRange column is false.</li></ul>                                   |  |
| Datetime         | <pre>delete row: ((Date &gt;= DATE(2014, 01, 01)) &amp;&amp; (Date &lt;= DATE(2014, 12, 31)))</pre>     | Delete all rows in which the Date value falls somewhere in 2014.  |  |
| String           | <pre>derive type:single value:((LEFT (USStates,1) == "A") &amp;&amp; (RIGHT (USStates,1) == "A"))</pre> | <p>For U.S. State names, the generated column contains true for the following values:</p> <ul style="list-style-type: none"><li>Alabama</li><li>Alaska</li><li>Arizona</li></ul> <p>For all other values, the generated value is false.</p> | <ul style="list-style-type: none"><li>See <i>LEFT Function</i>.</li><li>See <i>RIGHT Function</i>.</li></ul> |

### or

| Column Type | Example Transform | Output | Notes |
|-------------|-------------------|--------|-------|
|-------------|-------------------|--------|-------|

|                  |   |   |  |
|------------------|---|---|--|
| Integer /Decimal | <pre>set col:BigOrder value:((Total &gt; 1000000)    (Qty &gt; 1000))</pre>                     | <ul style="list-style-type: none"> <li>In the <code>BigOrder</code> column, set the value to <code>true</code> if the value of <code>Total</code> is more than 1,000,000 or the value of <code>Qty</code> is more than 1000.</li> <li>Otherwise, the value is <code>false</code>.</li> </ul>              |  |
| Datetime         | <pre>delete row: ((Date &lt;= DATE(1950, 01, 01))    (Date &gt;= DATE(2050, 12, 31)))</pre>     | Delete all rows in the dataset where the <code>Date</code> value is earlier than 01/01/1950 or later than 12/31/2050.   |  |
| String           | <pre>derive type:single value:((Brand == 'subaru')    ('Color' == 'green')) as:'good_car'</pre> | <ul style="list-style-type: none"> <li>Generate the new <code>good_car</code> column containing <code>true</code> if the <code>Brand</code> is <code>subaru</code> or the <code>Color</code> is <code>green</code>.</li> <li>Otherwise, the <code>good_car</code> value is <code>false</code>.</li> </ul> |  |

## not

| Column Type      | Example Transform  | Output   | Notes |
|------------------|--|--|-------|
| Integer /Decimal | <pre>keep row:!((sqft &lt; 1300) &amp;&amp; (bath &lt; 2) &amp;&amp; (bed &lt; 2.5))</pre> | Keep all rows for houses that do not meet any of these criteria: <ul style="list-style-type: none"> <li>smaller than 1300 square feet,</li> <li>less than 2 bathrooms,</li> <li>less than 2.5 bedrooms.</li> </ul> |       |
| Datetime         | <pre>keep row:!(YEAR(Date) == '2016')</pre>  | Keep all rows in the dataset where the year of the <code>Date</code> value is not 2016.  |       |
| String           | <pre>delete row:!(status == 'Keep_It')</pre>   | Delete all rows in which the value of the <code>status</code> column is not <code>Keep_It</code> .   |       |
