

Type Conversions

When data is imported :

- Supported data types from the source are converted to data types supported by the application.
- Types that are not supported but are recognized by the application are converted to String types.
- Types that cannot be read from the source due to technical reasons are converted to null values on import.

Tip: If you are having trouble getting your imported dataset to map to expected data types, you can disable type inference for the individual dataset. For more information, see *Import Data Page*.

On export, unmapped types are converted to the equivalent of strings.

Tip: You can import a target schema to assist in lining up your columns with the expected target. For more information, see *Overview of RapidTarget*.
