

# EXAMPLE - Unixtime Functions

This example illustrates how you can use functions to manipulate Unix time values in a column of Datetime type.

- `UNIXTIME` - Returns the Unix time value computed from a Datetime value. See *UNIXTIME Function*.
- `UNIXTIMEFORMAT` - Formats a Unix time value in the specified manner. See *UNIXTIMEFORMAT Function*.

## Source:

date
2/8/16 15:41
12/30/15 0:00
4/26/15 7:07

## Transform:

Use the following to generate a column containing the above values as Unix timecode values:

```
derive type:single value: UNIXTIME (date)
```

## Results:

**NOTE:** If the source Datetime value does not contain a valid input for one of these functions, no value is returned.

date	unixtime_date
2/8/16 15:41	1454946120000
12/30/15 0:00	1451433600000
4/26/15 7:07	1430032020000
