While transforming your data, you may need to change the data type of one or more columns. For example, data of String type may be the easiest to manipulate. Since there are no mismatched values for String data type, you may wish to change a column's data type to this baseline type.

- Data types that you see in the Transformer page represent types that are understood by the product.
- When data is imported from a separate datastore, Trifacta Self-Managed Enterprise Edition may apply internal data types to the data. These types may differ from the original data typing in the source. As needed, the inferring of data types can be disabled at the file, connection, or global level. For more information, see [Disable Type Inference](#).
- When data is published from the product to a separate datastore, these types may be mapped to different data types in the target. For more information, see [Type Conversions](#).

You can change a column's data type in one of the following ways.

For more information on the available data types, see [Supported Data Types](#).

A Note about Datetime Data Type

If you are changing a column's data type to Datetime, you must also select a format string to apply to the column. In the column menus, the available options can be selected after you select Datetime.

For more information, see [Datetime Data Type](#).

Change from Column Menus

You can change the data type for individual columns through the following column menus:

1. To the left of the column name, you can click the icon and select a new data type from the list.

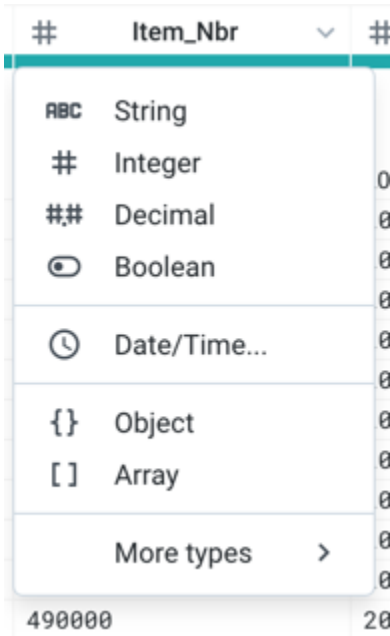

Figure: Column Data Type Menu

2. To the right of the column name, you can click the caret to open the column menu. Select **Change Type** and make a selection from the sub-menu.

 **Tip:** Both of the above methods become individual steps in your recipe.

Change Data Type for Multiple Columns

If you must change the data type for multiple columns to a single data type, you can use a transformation like the following, which changes the columns `LastName`, `FirstName`, and `Address` to String data type.

Transformation Name	Change column type
Parameter: Column 1	LastName
Parameter: Column 2	FirstName
Parameter: Column 3	Address
Parameter: New Type	String

 **NOTE:** When specifying a data type by name, you must use the internal name value for the type. The value listed in the column menu is the display name for the type.

For more information, see *Valid Data Type Strings*.
