

# CLI Config File

As an alternative to including admin passwords in each command that is executed, you can insert a set of admin credentials into a configuration file. The file location is the following:

```
~/trifacta/config.json
```

One or more sets of credentials can be specified in the following format:

```
{
  "credentials": {
    "usernameX": "passwordX",
    "usernameY": "passwordY"
  }
}
```

In your scripts, you can specify just the value for `admin_username`, and the config file is checked for the appropriate password, which is applied to the command.

**NOTE:** The permissions on this config file should be set such that only the user executing the command can read the file.
